

[So Setup So Set Up Yahoo Email](#)

POP Access Settings

In order to read your Yahoo! Mail on an external email client (such as Eudora, Outlook) you need to set up the server settings so that it can send and receive messages from your Yahoo! Mail account using your particular email program.

Important: Do not delete your incoming mail settings

If you are already receiving mail from another mail server (such as incoming mail to a different email address), this is called a new "profile," sometimes a new "personality," depending on your email client. At any time, make sure you write down your current settings before you replace them with the new settings for accessing your Yahoo! Mail.

Server Settings

Incoming Mail Server (POP3): **pop.mail.yahoo.com**

Use SSL, port: 995

Outgoing Mail Server (SMTP): **smtp.mail.yahoo.com**

Use SSL, port: 465, use authentication

Account Name/Username: **[redacted]@yahoo.co.uk**

Email address: **[redacted]@yahoo.co.uk**

Password: **Your Yahoo! Mail password**

We've given directions below for configuring POP access to Yahoo! Mail for selected email clients. Remember, even after you configure your mail client to send and receive mail, you may need to adjust your settings to receive mail as well.

For more detailed information on how to set up a particular mail client, please visit:
